## Definition

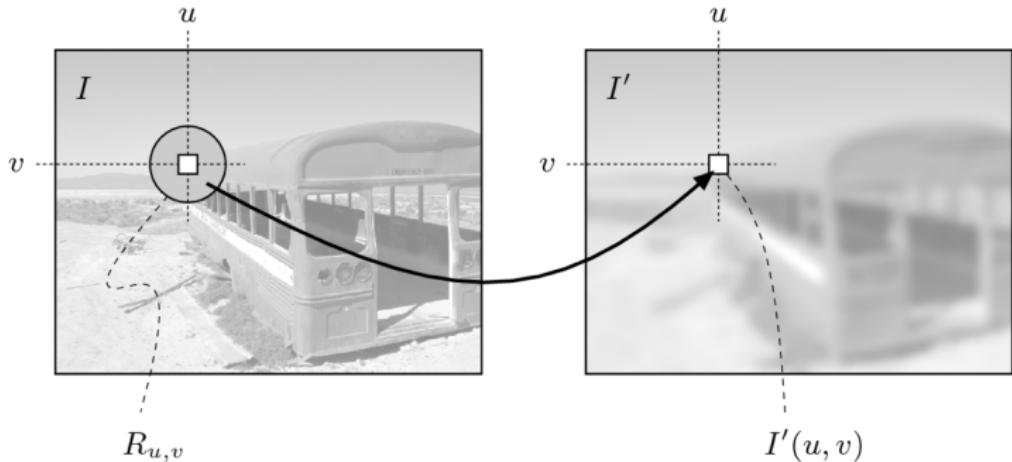

Local processing is an image operation where each pixel value  $I(u, v)$  is changed by a **function** of the intensities of pixels in a **neighborhood** of the pixel  $(u, v)$ .

# Linear processing function

Consider an averaging function on square window. In general, the window can have different size of each dimension. The output of the averaging is determined by.

$$I'(u, v) = \frac{1}{(2r+1) \times (2r+1)} \sum_{i=-r}^r \sum_{j=-r}^r I(u+i, v+j)$$

$I'(u, v)$  can be written as

$$I'(u, v) = \sum_{i=-r}^r \sum_{j=-r}^r I(u+i, v+j).H_{corr}(i, j)$$

## Mean function

- ①  $H_{corr}$  is a matrix of size  $(2r + 1) \times (2r + 1)$
- ②  $H_{corr} = \frac{1}{(2r+1) \times (2r+1)} M_{ones}$   
and,
- ③  $M_{ones}$  : is an matrix of size  $(2r + 1) \times (2r + 1)$   
containing value 1 for all elements.

### Example

Matrix for averaging pixels in a neighborhood of size  $5 \times 5$ ,  
i.e.,  $r = 2$ .

$$H_{corr} = \frac{1}{5 \times 5} \times \begin{bmatrix} 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 1 \end{bmatrix}$$

Local processing

Linear processing

Correlation

Convolution

Linear Filtering

Popular Linear Filter

Convolution's Properties

Convolution's  
implementation

## From averaging function to others

### A way to construct other linear processing functions

If one changes  $H_{corr}$  to other kinds of matrix, he obtains other linear function.

#### Example

Edge detecting function (Sobel)

$$H_{corr} = \begin{bmatrix} 1 & 0 & -1 \\ 2 & 0 & -2 \\ 1 & 0 & -1 \end{bmatrix} \quad H_{corr} = \begin{bmatrix} 1 & 2 & 1 \\ 0 & 0 & 0 \\ -1 & -2 & -1 \end{bmatrix}$$

Shifting function

$$H_{corr} = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{bmatrix}$$

## Definition

Input data:

- ① Input image,  $I(u, v)$
- ② Matrix  $H_{corr}(i, j)$  of size  $(2r + 1) \times (2r + 1)$ . In general, the size on two dimensions maybe different.

**Correlation** is defined as follows:

$$I'_{corr}(u, v) = \sum_{i=-r}^r \sum_{j=-r}^r I(u + i, v + j) \cdot H_{corr}(i, j)$$

**Figure:** Method for computing the correlation for one pixel

## A computation process

For each pixel  $(u, v)$  on the output image, do:

- ① **Place** matrix  $H_{corr}$  centered at the corresponding pixel, i.e., pixel  $(u, v)$ , on the input image
- ② **Multiply** coefficients in matrix  $H_{corr}$  with the underlying pixels on the input image.
- ③ **Compute** the sum of all the resulting products in the previous step.
- ④ **Assign** the sum to the  $I'(u, v)$ .

Local processing

Linear processing

Correlation

Convolution

Linear Filtering

Popular Linear Filter

Convolution's Properties

Convolution's implementation

## Definition

Input data:

- ① Input image,  $I(u, v)$
- ② Matrix  $H_{conv}$  of size  $(2r + 1) \times (2r + 1)$ . In general, the size on two dimensions maybe different.

**Convolution** is defined as follows:

$$I'_{conv}(u, v) = \sum_{i=-r}^r \sum_{j=-r}^r I(u - i, v - j) \cdot H_{conv}(i, j)$$

Local processing

Linear processing

Correlation

Convolution

Linear Filtering

Popular Linear Filter

Convolution's Properties

Convolution's implementation

## Natation

- Operator \* is used to denote the convolution between image  $I$  and matrix  $H_{conv}$
- That is

$$\begin{aligned} I'_{conv}(u, v) &= I * H_{conv} \\ &= \sum_{i=-r}^r \sum_{j=-r}^r I(u - i, v - j) \cdot H_{conv}(i, j) \end{aligned}$$

Local processing

Linear processing

Correlation

Convolution

Linear Filtering

Popular Linear Filter

Convolution's Properties

Convolution's implementation

## Attention!

- When  $I$  is a gray image, both of  $I$  and  $H_{conv}$  are matrices.
- However,  $I * H_{conv}$  is convolution between  $I$  and  $H_{conv}$ , **instead of matrix multiplication!**

Local processing

Linear processing

## Mathematics

$$I'_{conv}(u, v) = \sum_{i=-r}^r \sum_{j=-r}^r I(u - i, v - j) \cdot H_{conv}(i, j)$$

$$I'_{corr}(u, v) = \sum_{i=-r}^r \sum_{j=-r}^r I(u + i, v + j) \cdot H_{corr}(i, j)$$

Local processing

Linear processing

Correlation

Convolution

Linear Filtering

Popular Linear Filter

Convolution's Properties

Convolution's implementation

In mathematics, convolution and correlation are different in the **sign** of  $i$  and  $j$  inside of  $I(u + i, v + j)$  and  $I(u - i, v - j)$

## Convolution to Correlation

- Let  $s = -i$  and  $t = -j$
- We have

$$\begin{aligned} I'_{conv}(u, v) &= \sum_{i=-r}^r \sum_{j=-r}^r I(u - i, v - j) \cdot H_{conv}(i, j) \\ &= \sum_{i=-r}^r \sum_{j=-r}^r I(u + s, v + t) \cdot H_{conv}(-s, -t) \end{aligned}$$

Local processing

Linear processing

Correlation

Convolution

Linear Filtering

Popular Linear Filter

Convolution's Properties

Convolution's implementation

$H_{conv}(-s, -t)$  from  $H_{conv}(i, j)$

$H_{conv}(-s, -t)$  can be obtained from  $H_{conv}(i, j)$  by either

- Flipping  $H_{conv}(i, j)$  on x and then on y axis
- Rotating  $H_{conv}(i, j)$  around its center  $180^\circ$

## Example

Demonstration of rotation and flipping.

$$H = \begin{bmatrix} ① & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix} \quad H_{flipped\_x} = \begin{bmatrix} 3 & 2 & ① \\ 6 & 5 & 4 \\ 9 & 8 & 7 \end{bmatrix}$$

$H_{flipped\_x}$  is obtained from  $H$  by flipping  $H$  on x-axis.

After flipping  $H_{flipped\_x}$  around y axis

$$H_{flipped\_xy} = \begin{bmatrix} 9 & 8 & 7 \\ 6 & 5 & 4 \\ 3 & 2 & ① \end{bmatrix}$$

$H_{flipped\_xy}$  can be obtained from  $H$  by rotating  $H$   $180^0$  around  $H$ 's center.

## Correlation to Convolution

- Let  $s = -i$  and  $t = -j$
- We have

$$\begin{aligned} I'_{corr}(u, v) &= \sum_{i=-r}^r \sum_{j=-r}^r I(u + i, v + j) \cdot H_{corr}(i, j) \\ &= \sum_{i=-r}^r \sum_{j=-r}^r I(u - s, v - t) \cdot H_{corr}(-s, -t) \end{aligned}$$

$H_{corr}(-s, -t)$  from  $H_{corr}(i, j)$

$H_{corr}(-s, -t)$  can be obtained from  $H_{corr}(i, j)$  by either

- Flipping**  $H_{corr}(i, j)$  on x and then on y axis
- Rotating**  $H_{corr}(i, j)$  around its center  $180^\circ$

Local processing

Linear processing

Convolution

Linear Filtering

Popular Linear Filter

Convolution's Properties

Convolution's implementation

## Relationship

- ① Convolution can be computed by correlation and vice versa.
- ② For example, convolution can be computed by correlation by: first, (a) rotating the matrix  $180^0$  and then (b) computing the correlation between the rotated matrix with the input image.

Convolution

Linear Filtering

Popular Linear Filter

Convolution's Properties

Convolution's implementation

Original image

Shifted with  $d = [-2, 2]$

## Commutativity:

$$I * H = H * I$$

## Meaning

- ① This means that we can think of the image as the kernel and the kernel as the image and get the same result.
- ② In other words, we can leave the image fixed and slide the kernel or leave the kernel fixed and slide the image.

Local processing

Linear processing

Correlation

Convolution

Linear Filtering

Popular Linear Filter

Convolution's Properties

Convolution's implementation

## Associativity:

$$(I * H_1) * H_2 = I * (H_1 * H_2)$$

## Meaning

- ① This means that we can apply  $H_1$  to  $I$  followed by  $H_2$ , or we can convolve the kernel  $H_2 * H_1$  and then apply the resulting kernel to  $I$ .

Local processing

Linear processing

Correlation

Convolution

Linear Filtering

Popular Linear Filter

Convolution's Properties

Convolution's implementation

## Linearity:

$$\begin{aligned}(\alpha \cdot I) * H &= \alpha \cdot (I * H) \\(I_1 + I_2) * H &= I_1 * H + I_2 * H\end{aligned}$$

## Meaning

- ① This means that we can multiply an image by a constant before or after convolution, and we can add two images before or after convolution and get the same results.

Local processing

Linear processing

Correlation

Convolution

Linear Filtering

Popular Linear Filter

Convolution's Properties

Convolution's implementation

## Shift-Invariance

Let  $S$  be an operator that shifts an image  $I$ :

$$S(I)(u, v) = I(u + a, v + b)$$

Then,

$$S(I * H) = S(I) * H$$

## Meaning

- ① This means that we can convolve  $I$  and  $H$  and then shift the result, or we can shift  $I$  and then convolve it with  $H$ .

Local processing

Linear processing

Correlation

Convolution

Linear Filtering

Popular Linear Filter

Convolution's Properties

Convolution's implementation

## Separability

A kernel  $H$  is called separable if it can be broken down into the convolution of two kernels:

$$H = H_1 * H_2$$

More generally, we might have:

$$H = H_1 * H_2 * \dots * H_n$$

## Methods for implementing convolution and correlation

### ① In space domain:

- Use sliding widow technique
- Use speed-up methods for special cases

### ② In frequency domain: will be presented in next chapter

## Sliding window technique for correlation

For each pixel  $(u, v)$  on the output image, do:

- ① **Place** matrix  $H_{corr}$  centered at the corresponding pixel, i.e., pixel  $(u, v)$ , on the input image
- ② **Multiply** coefficients in matrix  $H_{corr}$  with the underlying pixels on the input image.
- ③ **Compute** the sum of all the resulting products in the previous step.
- ④ **Assign** the sum to the  $I'(u, v)$ .

Convolution can be computed by rotating the kernel  $180^0$  followed by the above algorithm.

# Convolution's complexity

## Computational Complexity of sliding window technique

- Input image  $I$  has size  $N \times M$
- Kernel's size is  $(2r + 1) \times (2r + 1)$
- Then, the number of operations is directly proportional to:  $MN[(2r + 1)^2 + (2r + 1)^2 - 1]$ .
- **The computational complexity is  $O(MNr^2)$**

## Attention!

- The cost for computing convolution and correlation is **directly proportional** to the kernel's size!
- The filtering process will be slower if the kernel's size is bigger.
- The computational cost of the implementation in frequency domain is independent with the kernel's size.

## Example

To shift an image  $I$  to left 10 pixels. We can apply the following methods:

- ① **Method 1:** Filter  $I$  with a shifting kernel of size  $21 \times 21$ .
- ② **Method 2:** Apply 10 times shifting kernel of size 3.

Which method can result better computation cost?

## Answer

Number of operations for each method is proportional to:

- ① **Method 1:**  $MN \times (21^2) = 441MN$
- ② **Method 2:**  $10 \times MN \times (3^2) = 90MN$

Method 2 is better than Method 1!

Local processing

Linear processing

Correlation

Convolution

Linear Filtering

Popular Linear Filter

Convolution's Properties

Convolution's implementation

Because, we have

## Associativity:

$$(I * H_1) * H_2 = I * (H_1 * H_2)$$

**So, we can save the computational cost by using separability**

If we can separate a kernel  $H$  into two smaller kernels

$H = H_1 * H_2$ , then it will often be cheaper to apply  $H_1$  followed by  $H_2$ , rather than  $H$ .

# Convolution's complexity

## Example

Kernel  $H$  can be decomposed into  $H = H_1 * H_2$ , as follows:

$$H_1 = \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} \quad H_2 = \begin{bmatrix} -1 & 0 & 1 \end{bmatrix}$$

$$H = H_1 * H_2 = \begin{bmatrix} -1 & 0 & 1 \\ -2 & 0 & 2 \\ -1 & 0 & 1 \end{bmatrix}$$

Using associativity, we can filter image  $I$  with  $H$  by either

- ① **Method 1:**  $I' = I * H$
- ② **Method 2:**  $I' = (I * H_1) * H_2$

Which method is better?

## Answer

Number of operations for each method is proportional to:

- ① **Method 1:**  $MN \times (3^2) = 9MN$
- ② **Method 2:**  $(MN \times 3) + (MN \times 3) = 6MN$

Method 2 is better than Method 1!

Local processing

Linear processing

Correlation

Convolution

Linear Filtering

Popular Linear Filter

Convolution's Properties

Convolution's implementation

## Special cases

- ① **Separability:** In the case that kernel filter  $H$  can be separated into smaller kernels. Consecutively apply smaller kernels to the input image can reduce the computation time, as shown in previous slide.
- ② **Box Filtering:** Kernel's coefficients of box filter are equal (value 1). So, we can use **integral image** to speed up.

## CASE 1: 1D-array

### 1D Box filter's response

The sum of elements in any window, occupying from  $A[i]$  to  $A[j]$ , can be computed fast by:  $C[j] - C[i - 1]$

$A[i]$		3	8	2	6	9	7	1
	0	1	2	3	4	5	6	7
$C[i]$	0	3	11	13	19	28	35	36
	0	1	2	3	4	5	6	7

### Example

- ①  $\sum_{i=1}^4 A[i] = C[4] - C[0] = 19 - 0 = 19$
- ②  $\sum_{i=2}^6 A[i] = C[6] - C[1] = 35 - 3 = 32$
- ③  $\sum_{i=3}^6 A[i] = C[6] - C[2] = 35 - 11 = 24$

## CASE 2: 2D-array

- Input data: Image  $I(u, v)$ , for  $u, v \in [1, n]$ 
  - The first row and the first column are not used
- Output data: **integral image**  $S(u, v)$ . It is defined as follows.
  - ① The first row and the first column contains zeros, i.e.,

$$S(0, i) = S(j, 0) = 0; i, j \in [0, n]$$

②

$$S(u, v) = \sum_{i=1}^u \sum_{j=1}^v I(i, j)$$

## CASE 2: 2D-array

### A method for computing $S(u, v)$

- ① for each element in the first row and the first column in  $S(u, v)$ , assign zero to it.
- ② for each remaining element at  $(u, v)$ :  $S(u, v) = S(u - 1, v) + S(u, v - 1) - S(u - 1, v - 1) + I(u, v)$

## The Way to compute the filter's response

- ① Let  $A, B, C, \text{and } D$  are the sum of all pixels in rectangle from  $O$  to  $A, B, C, \text{and } D$  respectively.
- ② The sum of pixels inside of rectangle  $ABCD$  is  $(C - B - D + A)$

## The Way to compute the filter's response

$$\begin{aligned}I'(u_2, v_2) &= C - B - D + A \\&= S(u_2, v_2) - S(u_1, v_2) - S(u_2, v_1) + S(u_1, v_1)\end{aligned}$$
